                                                                                                                                       The invention relates to an isolated stem cell growth factor-like polyperide (referred as supporting factor for proliferation of stem cells (SCR-1) from mouse or human, or its mature protein portion, or tragement, analogue, variant or carrivative, that retains stem cell growth factor activity. Also included are an isolated polymucleotide encoding SCR-1 (or its mature protein portion or fragement, analogue, variant or carrivative, that retains stem cell growth factor activity or the complement of the polymucleotide, a host cell growth factor activity or the complement of the polymucleotide, a host cell growth factor activity or the complement of the polymucleotide, a polypeptide or comprising the SCR-1 polymethed or carrivation with a regulatory sequence or comprision of the SCR-1 polymethed. A provise that controls expression of the SCR-1 polymethed with a provise that controls expression of the SCR-1 polymethed with a provise that controls expression product of the SCR-1 polymethed with a provise that cereminate and activity to support proliferation or survival of basentopoietic stem of activity and activity and activity and activity to support proliferation or survival of or promore proliferation of a stem consolated soft and an analogue or hasmatopoietic progenies the as from ABO44430, an isolated polypeptide with stem cell growth factor activity baving at least an as a sequence appearing as ABO44430, an isolated polypeptide consolativity of or actoric paninal survival of or promore proliferation of a stem cell or germ cell and an implant comprising the SCR-1 polymethed to surpore proliferation or centraling the SCR-1 polymethed as attached to express the SCR-1 polypeptide to support proliferation or survival of a stem cell or germ cell and an implant comprising or cell or germ cell and an implant comprising or cell or germ cell and an implant or survival of a stem cell or germ cell and an implant or survival of a stem cell or germ cell and an implant or cell certain or survival of a stem cell or germ cell a
                                                                                   Claim 23; Fig 3; 96pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 272 AA;

The patent discloses novel stem cell growth factor-like proteins and polymucleotides encoding them. Proteins of the invention are also known as supporting factor for the proliferation of stem cells (SCR-1). Stem cell growth factor-like proteins are useful for supporting proliferation or survival of a stem cell, embryonic stem cell, paramatopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell pluripotent cell growth cell. The haematopoietic progenitor cell pluripotent cell growth cell. The haematopoietic progenitor cell cultured using stem cell growth cell. The haematopoietic progenitor cell cultured using stem cell growth cell. The haematopoietic progenitor cell cultured using stem cell growth cell can replace as a graft for the bone marrow cell diseases such as immunodeficiency syndrome, chronic granulomatous diseases, duplicated immunodeficiency syndrome, agammaglobulinaemia, wiskott-Aldrich syndrome, acquired immuno deficiency syndrome (AIDS) chalassemia, haemolytic anaemia due to enzyme defect, congenital anaemia cell seases such as sickle cell anaemia (Gaucher's disease, lysosomal storage degeneration, a variety of cancer and tumours. Proteins of the invention cell are useful for treating diseases such as Parkinson's disease, Alzheimer's immunos.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (SCID)) and autoimmune disorders such as multiple sclerosis, systemic upus erythematosus, rheumatoid arthritis, and autoimmune pulmonary inflammation. Sequences of the invention are also useful in gene therapy. The present sequence is stem cell growth factor-like protein from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disease and other neurodegenerative diseases, thrombocytopaenia, immune deficiencies and disorders such as severe combined immunodeficiency

Chao C;

The invention relates to an isolated stem cell growth factor-like polypeptide (Ireferred as supporting factor for proliferation of stem coll growth call (GEGT-1)) from mouse or human, or its mature protein portion, or fragment, analogue, variant or derivative, that retains stem cell growth factor activity. Or the chartwative, that retains stem cell growth factor activity, or the derivative bat retains stem cell growth factor activity, or the carrial stem cell growth factor activity, or the strength of the polyuncleotide, a host cell genetically empiresed to contain the comport proparation of the SCR-1 polymentectide in operative association with a regulatory sequence that controls expression of the polymelectide that he having an expression product of the SCR-1 polymented that a proviso that Cell, not preparation of the SCR-1 polymented or survival of the comport proliferation or survival of the comport proliferation or survival of contained scR-1 polymented as sequence appearing as ABG44438 and ABG44438 and ABG44439, a culture medium comprising the SCR-1 polymented contained and the scr-1 polymented or activity having at least an as sequence appearing as ABG44438 and ABG44439, a culture medium comprising the SCR-1 polymented contained to maintain survival of or promote proliferation or survival of sem cell or germ cell, and an implant comprising the SCR-1 polymented to surface, a strong conting and the SCR-1 polymented to support proliferation or survival of a sem cell or germ cell or germ cell or germ cell or germ cell or a surface, a strong cell call or a surface, a strong conting and contained to express the SCR-1 polymented call or support proliferation or survival of a sem cell or germ cell or germ cell or a surface, a strong cell or germ cell or germ cell or germ cell or a surface, a strong cell or germ cell or a surface, a strong cell or a surface, a strong c Novel isolated polypeptide having stem cell growth factor activity, useful for promoting wound healing, and as a medicine to proliferate or support human hematopoietic stem cells or human hematopoietic progenitor Claim 23; Page 72-73; 96pp; English.

The particulations in the control of the invention are also known as supporting factor for the proliferation of stem cells (SCR-1). Stem cell growth factor-like proteins are useful for supporting proliferation or survival of a stem cell or germ cell which is preferably primordial germ cell, germ line stem cell, embryonic stem cell, haematopoietic stem cell, haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, pluripotent cell or totipotent cell. The haematopoietic progenitor cell, cell or totipotent cell. The haematopoietic progenitor cell. The bone marrow cell canappantation or cord blood transplantation for treating a variety of disease, duplicated immunodeficiency syndrome, chronic granulomatous disease, duplicated immunodeficiency syndrome, agammaglobulinaemia, wiskott-Aldrich syndrome, acquired immune deficiency syndrome (AIDS). Thalsassemia, haemolytic anaemia due to enzyme defect, congenital anaemia cuch as sickle cell anaemia, Gaucher's disease, lysosomal storage degeneration, a variety of cancer and tumours. Proteins of the invention are useful for treating diseases such as Barkinson's disease, Alzheimer's deficiencies and other neurodegenerative diseases, thrombocytopaenia, immune deficiency control of the control of t

Novel isolated polypeptide having stem cell growth factor activity, useful for promoting wound healing, and as a medicine to proliferate or support human hematopoietic stem cells or human hematopoietic progenitor

Disclosure; Pig 3; 96pp; English.

The invention relates to an isolated stem cell growth factor-like polypeptide (referred as supporting factor for proliferation of stem cells (SCR-1)) from mouse or human, or its mature protein portion, or fragment, analogue, variant or derivative, that retains stem cell growth factor activity. Also included are an isolated polynucleotide encoding CSCR-1 (or its mature protein portion, or fragment, analogue, variant or derivative, that retains stem cell growth factor activity, or the complement of the polymucleotide, a host cell growth factor activity, or the complement of the polymucleotide in operative association with a regulatory sequence SCR-1 polymucleotide in the host cell, that controls expression of the polymucleotide in the host cell, preparation of the SCR-1 polymucleotide (the polypeptide having an expression product of the SCR-1 polymucleotide (the polypeptide having an expression product of the SCR-1 polymucleotide (the polypeptide having an activity to support proliferation or survival of haematopoietic stem cell, with a provise that C-terminal as sequence does not comprise the as sequence appearing as ABO44439, an isolated SCR-1 polypeptide with stem cell growth factor activity and solated SCR-1 polypeptide with stem cell growth factor activity and isolated polypeptide to maintain survival of or promote proliferation of a stem cell or grown comprising the SCR-1 polypeptide or a unique segment of the SCR-1 polymucleotide or a unique segment of the SCR-1 polymucleotide or a stromal cell genetic or survived to surface, a stromal cell genetic or survived to surface, a stromal cell genetic or survived to surface, a stromal cell series or surface or surface, a stromal cell series or surface or engineered to express the SCR-1 polypeptide to support proliferation or survival of a stem cell or germ cell and an implant comprising a cell genetically engineered to express the SCR-1 polypeptide to support proliferation or survival of a stem cell or germ cell. The SCR-1 polypeptide is useful for identifying a compound that binds to the SCR-1 polypeptide and for maintaining survival of or promoting proliferation of a stem cell, a germ cell, a perm cell or a haematopoietic progenitor cell. The SCR-1 polypeptide is useful for promoting wound

```
healing. The human haematopoletic stem cell or human haematopoletic progenitor cell culture using the SCR-1 polypeptide can replace as a graft for the conventional bone marrow transplantation or cord blood transplantation. The transplantation of haematopoletic stem cells can be employed as a therapy for treating diseases such as chronic granulomatous diseases, duplicated immunodeficiency syndrome, agammaglobulinaemia, wiskott-Aldrich syndrome, AIDS, etc., thalassaemia, haemolytic anaemia due to enzyme defect, congenital anaemia such as sicklaemia, disease etc. the SCR-1 polypeptide is useful for cell growth and morphogenesis, including tissue specific stem cell growth, epithelial cell growth and regulation, ovarian follicle development, promoting nerve cell growth, sustaining neuronal populations, cartilage remodeling, bone
                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

The patent discloses novel stem cell growth factor-like proteins and polymucleotides encoding them. Proteins of the invention are also known as supporting factor for the proliferation of stem cells (STEM—1). Stem cell growth factor-like proteins are useful for supporting proliferation or survival of a stem cell, embryonic stem cell, germ cell, germ cell, embryonic stem cell, parantopoletic progenitor cell, embryonic stem cell, parantopoletic progenitor cell, pluripotent cell or totipotent cell. The haematopoletic progenitor cell cultured using stem cell growth factor-like proteins can replace as a graft for the bone marrow transplantation or cord blood transplantation for treating a variety of diseases such as immunodeficiency syndrome, agammaglobulinaemia, wiskott-Aldrich syndrome, acquired immune deficiency syndrome (Arsonic Standard, haemolytic anaemia denote to enzyme defect, congenital anaemia degeneration, a variety of cancer and tumours. Proteins of the invention are useful for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, thrombocytopeania, immune deficiencies and disorders such as multiple sclerosis, systemic collupus erythematosus, thumatoid immune disorders such as multiple sclerosis, systemic lupus erythematosus, heumatoid arthritis, and autoimmune disorders such as multiple sclerosis, systemic lupus erythematosus, heumatoid arthritis, and autoimmune disorders such as multiple sclerosis, systemic lupus erythematosus, heumatoid arthritis, and autoimmune disorders such as multiple aclerosis, systemic lupus erythematosus, heumatoid arthritis, and autoimmune disorders such as such as multiple sclerosis, systemic lupus erythematosus, heumatoid arthritis, and autoimmune disorders such as an autopined inamune disorders and althritism erythematosus, heumatoid arthritism and autoimmune disorders and arthritism and autoimmune disorde
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

The invention relates to human secreted or transmembrane protein (I), their fragments and is encoded by specific complementary decyribonucleic acid (cDNA) inserts (II), where the protein is substantially free from other mammalian proteins. (I) are useful for preventing, treating or meliorating a medical condition, especially immunological treatment or prevention of tumoures. (I) exhibits activity relating to angiogenesis, cytokine, cell proliferation, cell differentiation, antiinflammatory, stem cell growth factor activity and activin or inhibin-related cytokine. (I) can be used to manipulate stem cells in culture to give crise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease, accidental damage or genetic disorders. (I) induces the proliferation of neural cells and central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis. (I) is involved in chemotactic or chemokinetic artivity, regulation of haematopolesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopaenia
                                                                                                                                                                                                                                        Human; cytostatic; antirheumatic; antiarthritic; vulnerary; analgesic; antinflammatory; antibacterial; immunosuppressive; antiparklnsonian; meuroprotective; nootropic; osteopathic; haemostatic; vasotropic; antiulcer; fungicide; antidiabetic; antiasthmatic; antiallergic; immunostimulant; antiparasitic; secreted protein; transmembrane protein; cytokine; cell proliferation; cell differentiation; autoimmune disease; stem cell; growth factor; nervous system disease; neuropathy; Alzheimer's disease; Parkinson's disease; Huntington's disease; osteoporosis; severe combined immunodeficiency; SCID; infection; multiple sclerosis; rheumatoid arthritis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel secreted or transmembrane protein and polymucleotide encoding the protein, useful for diagnosis and treatment of neurological disorders, cancer, autoimmune diseases, bone disorders and lung or liver fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Collins-Racie LA,

```
New stem cell growth factor-like polypeptides and polymucleotides, useful for treating e.g. leukemia, hemophilia and degenerative diseases like Alzheimer's disease, and for inducing immune response.
```

Disclosure; Fig 2; 151pp; English.

The invention relates to new stem cell growth factor-like polypeptides and polynucleotides. The stem cell growth factor-like polypeptides and polynucleotides are useful for inducind differentiation of embryonic and adult stem cells to give rise to different cell types, for treating e.g. leukaemia, haemophilia and degenerating different cell types, for treating e.g. leukaemia, haemophilia and degenerating use tissues and organs that considered in need of transplanted tissues. The polynucleotides are useful as hybridisation probes, oligomers or primers for PCR, for chromosome and gene mapping, in recombinantly producing protein, in concerning antisense DNA or RNA, in diagnostics as expressed sequence tags for identifying expressed genes, and for inducing immune response. The polypeptides are useful for generating antibodies that specifically bind the polypeptides are useful for generating antibodies that specifically chind the polypeptides as molecular weight markers, and as a food supplement (e.g. protein or amino acid supplement, and as a carbon, nitrogen or carbohydrate source). Compositions comprising the polypeptides or polymucleotides are useful for the diagnosis, treatment or prevention of cancers, and other immunological disorders. The current sequence represents a human secreted protein clone da_288_6

probable proprotein convertase (BC 3.4.21.-) 5 precursor - rat

N.Alternate names: PC5 precursor
C.Species: Rattus norvegicus (Norvay rat)
C.Species: Rattus norvegicus (Norvay rat)
C.Species: Rattus norvegicus (Norvay rat)
C.Species: B4825

F-spondin precursor - African clawed frog
C;Species: Xenopus laevis (African clawed frog)
C;Species: Xenopus laevis (African clawed frog)
C;Bate: 27-Jun-1994 #sequence_revision 27-Jun-1994 #text_change 17-Nov-2000
C;Accession: A47723
R;Ruiz i Altaba, A.; Cox, C.; Jessell, T.M.; Klar, A.
Proc. Natl. Acad. Sci. U.S.A. 90, 8268-8272, 1993
A;Title: Ectopic neural expression of a floor plate marker in frog embryos injected with A;Title: Ectopic neural expression of a floor plate marker in frog embryos injected with A;Title: Ectopic neural expression of a floor plate marker in frog embryos injected with A;Accession: A47723

Name=PCCS; Symonyma=Long;
Name=PCSS; Symonyma=Long;
Isoid=Q04592-1; Sequence=Displayed;
Name=PCSS; Symonyma=Long;
Isoid=Q04592-2; Sequence=VSP 005438, VSP 005439;
Isoid=VSP SPCIPICITY: PCSA is expressed in most tissues but is most the intestine, adrenals and lung but not in the brain.
PVEX.OPENCENTAL STAGE: Weakly expressed throughout the embryo, except in the developing nervous system, the sibs and the liver, but markedly upregulated at discrete sites during development. At 86.5, abundant expression in differenciated decidua. At 87.5, intense expression in extraembryonic endoderm, and and hascells of limb buds). At 812.5, expression in the limbs is confined to the condensing mesenchym surrounding the cartilage. At this stage, strong expression also detected in vertebral and facial cartilage primordia and in the muscle of the tongue. At 816.5, abundant expression in epithelial cells of the intestinal villi. Isoform A is most abundant at all stages but significant levels of isoform B occur at 812.5.
IsoMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic refired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. TATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Kaa-Yaa-ARG-|-Zaa bonds, where Kaa can be any amino acid and Yaa is Arg or Lys.

SUBCELLUIAL ROCATION: PC5A IS SECRETED THROUGH THE REGILATED SECRETORY PATHMAY. PC5B IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH
                                                                                                                                                                                                                                                                   for the maturation of gastrointestinal peptides. May be involved in the cellular proliferation of adrenal cortex via the activation of growth factors.
                                                                                                    Rancourt S.L., Rancourt D.B.,
"Murine subtilisin-like proteinase SPC6 is expressed during embryonic
"Murine subtilisin-like proteinase SPC6 is expressed during embryonic
implantation, somitogenesis, and skeletal formation.";
Dev. Genet. 21:75-81(1997).
-!- FUNCTION: Likely to represent a widespread endoprotease activity
within the constitutive and regulated secretory pathway. Capable
of cleavage at the RX(K/R)R consensus motif. May be responsible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Event=Alternative splicing; Named isoforms=2;

constitutive secretory pathway, with unique restricted
distribution in both neuroendocrine and non-neuroendocrine tissues
distribution in both neuroendocrine and non-neuroendocrine tissues
and capable of cleavage at the RK(R)R consensus motif.

-I- CATALYTIC ACTIVITY: Release of mature proteins from their
proproteins by cleavages of Arg-Kaa-RAG-|-Zaa bonds, where Xaa
can be any amino acid and Yaa is Arg or Lys.
-I- COPACTOR: Calcium (Potential).
-I- COPACTOR: Calcium (Potential).
-I- CUBMUNT: The PACEMA-I precursor protein seems to exist in the
reticulum endoplasmic as both a monomer, suggesting that
propeptide cleavage affects its tertiary or quaternary structure.
-I- SUBCELLUMAR LOCATION: PACEMA-I and PACEMA-II are secreted. PACEMC
and PACEMCS are not secreted and remain probably in zymogen form
in endoplasmic reticulum. PACEMB-I and PACEMB-II are retained
intracellularly probably through a hydrophobic cluster in their C-
terminus. PACEMB might be secreted.
                                  Mori K., Kii S., Tsuji A., Nagahama M., Imamaki A., Hayashi K., Akamatsu T., Nagamune H., Matsuda Y.; Andersu T., Nagamune H., Matsuda Y.; A novel human PACE4 isoforu, PACE4E is an active processing protease containing a hydrophobic cluster at the carboxy terminus."; J.                     Name=PACE4E-II;
ISOIG=P29122-8; Sequence=VSP 005436, VSP 005437;
ISOIG=VSP SEGA in heart, brain, placenta, lung, skeletal muscle, kidney, pancreas, but at comparatively higher levels in the liver. PACE4A-II is at least expressed in placenta. PACE4B was only found in the embryonic kidney cell line from which it was isolated. PACE4C and PACE4D are expressed in placenta. PACE4E-I is expressed in cerebellum, placenta and pituitary. PACE4E-II is at least present in
                                                                                                                                      Cerebellum.

DOMAIN: The propeptide domain acts as an intramolecular chaperone sesisting the folding of the zymogen within the endoplasmic reticulum. Isoform PACE4D lacks the propeptide domain.
SIMILARITY: Belongs to peptidase family S8.
SIMILARITY: Contains 1 homo B/P domain.
SIMILARITY: Contains 1 pLAC domain.
                                                                                                                                                                                                                                                              diffied and ...

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DOWAIN. AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R InterPro; IPR006212; Purin repeat.

Reudelhuber T.L.;
Submitted (FRB-1996) to the EWBL/GenBank/DDBJ databases.

-!- FUNCTION: Likely to represent a widespread endoprotesse activity
within the constitutive and regulated secretory pathway. Capable
of Cleavage at the RX(K/R)R consensus motif.

-!- CATALYTIC ACTIVITY: Release of mature proteins from their
proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa
can be any maino acid and Yaa is Arg or Lys.
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
                                                                                                                                                                                        IsoId=092824-1; Sequence=Displayed;
TISSUE SPECIFICITY: Expressed in T-lymphocytes.
DOWANT: The propeptide domain acts as an intramolecular chaperone
assisting the folding of the zymogen within the endoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CELL ATTACHMENT SITE (POTENTIAL).

-I- FUNCTION: Binds to WNT proteins and inhibits their activities. May be involved in mesoderm segmentation.
-I- SUBCELULIAR LOCATION: Secreted.
-I- TISSUB SPECIFICITY: During sometogenesis, expressed predominantly in unsegmented paraxial presomitic mesoderm and, to a much lesser extent, in newly segmented somites.
-I- DEVELOPMENTAL STAGE: First expressed at neurula stages.
-I- SIMILARITY: Contains 1 WIF domains.

  not heart.

10 DBVBLOPMENTAL STAGE: Expressed in the embryonic ventricular zone, the postnatal ependymal cells, and the choroid plexus throughout embryonic and postnatal development.

11 ETM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a cleaved by presentlin dependent gamma-secretase to release a cleaved by presentlin dependent gamma-secretase to release a cleaved by presentlin dependent gamma-secretase to release a cleaved by presentlin dependent gamma-secretase to release a cleaved by the membrane.

10 Intractive contains 35 EGF-like domains.

21 SIMILARITY: Contains 21 Lin/Antch repeats.

22 IMILARITY: Contains 2 Lin/Antch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Toonservation of the biochemical mechanisms of signal transduction are among mammalian Norch family members.;
Proc. Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).
L. FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl and Deltai to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NAICD) it forms a transcriptional activator complex with RB-J kappa and activates genes of the enhancer of split locus.
C. Affects the implementation of differentiation, proliferation and appotence programs (By similarity). May play an essential role in specification and/or differentiation.
C. --- SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-hands

SUBUNIT: TETRAMER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE PORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN.
SUBCELLULAR LOCATION: Type I membrane protein.
SUBCLELULAR LOCATION: Type I membrane protein.
SIMILARITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (IGF I)

(2001).

FUNCTION: Functions as a receptor for membrane-bound ligands Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs. May play an essential role in postimplantation

        hidney.

-!- DEWELOPWENTAL STAGE: Expressed in the brain during E14 and E17.
-!- PTM: Synthesized in the endoplasmic retlculum as an inactive form which is proteolytically cleaved by a furin-like convertace in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (WEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane [P8 similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. development, probably in some aspect of cell specification and/or differentiation (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

SUBCELLULAR PLOCATION: Type I membrane protein. Following proteclytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in the spleen and choroid plexus in the brain. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones. Also found in the heart, liver and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             POTENTIAL.

"Mutational analysis of bli-4/kpc-4 reveals critical residues required for proprotein convertase function in C. elegans.";
Gene 252.15-25(2000).
-!- FUNCTION: The Kex2/subtilisin-like proteinase activity of this enzyme is required for the normal production of adult cuticle.
There is functional redundancy between the isoforms. Vital for embryonic and larval development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note-No experimental confirmation available:
--- TISSUE SPECIFICITY: In larvae and adults, expressed in all hypodermal cells, vulva and ventral nerve cords.
--- DEVELOPMENTAL STAGE: Expression starts at embryo two-fold stage through to adults.
--- SIMILARITY: Belongs to peptidase family SB. Furin subfamily.
--- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 651.
--- CAUTION: Ref.2 (AAB96754 and AAB96757) sequence differs from that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEROPS; SOB.031; -...
